Electric Scooters for Cities

Petrol scooters are everywhere in India and they cause a lot of pollution. In this essay I will argue that cities should replace them with electric scooters.

Electric scooters do not produce smoke from an exhaust, so the air in cities would be cleaner. Delhi is often in the news for very bad air in winter and vehicles are one of the reasons. If everyone used electric scooters the air would improve a lot.

Electric scooters are also cheaper to run. Charging costs much less than filling petrol, and there are fewer parts that need servicing. My uncle bought one last year and he says he saves a lot of money every month.

The government is also giving subsidies so the price is coming down. More companies are making them now and there are many models to choose from.

There are some problems like charging. Many apartments do not have a place to charge and it takes a few hours. Also the batteries are expensive to replace. But I think these problems will be solved with time as technology improves.

In conclusion, electric scooters are better for the environment and cheaper to run, so cities should replace petrol scooters with them as soon as possible.
